

The Tortoise and the hare

ISSUE 57 | December 2015

Second-Hand News

Why don't the media run more good news? One view is bad news sells. If people preferred good news, the media would supply it. But markets don't see news as necessarily good or bad, rather in terms of what is already built into prices.

One academic study appears to confirm the view that the apparent preponderance of bad news is as much due to demand as to supply, with participants more likely to select negative content regardless of their stated preferences for upbeat news.¹

"This preference for negative and/or strategic information may be subconscious," the authors conclude. "That is, we may find ourselves selecting negative and/or strategic stories even as we state that we would like other types of information."

So an innate and unrecognised demand among consumers for bad news tends to encourage attention-seeking commercial media to supply more of what the public appears to want, thus fuelling a self-generating cycle.

Insofar as consumers of news are investors, though, the danger can come when the emotions generated by bad news prompt them to make changes to their portfolios, unaware that the news is likely already built into market prices.

This is especially the case when the notions of "good or bad" are turned upside down on financial markets. For example, stocks and Treasuries rallied and the US dollar weakened in early October after a weaker-than-expected US jobs report. Some observers said the "bad news" on jobs was "good news" for interest rates.²

Conversely, a month later, stocks ended mixed, bonds weakened and the US dollar rallied after a stronger-than-expected payrolls number. While an improving job market is good news, it was also seen by some as cementing the case for the Federal Reserve to begin raising interest rates.

In both cases, the important thing for markets was not whether the report was good or bad but how it compared to the expectations already reflected in prices. As news is always breaking somewhere, expectations are always changing.

Second-Hand News

For the individual investor seeking to make portfolio decisions based on news, this presents a real challenge. First, to profit from news you need to be ahead of the market. Second, you have to anticipate how markets will react. This does not sound like a particularly reliable investment strategy.

Luckily, there is another less scattergun approach. It involves working with the market and accepting that news is quickly built into prices. Those prices, which are forever changing, reflect the collective views of all market participants and reveal information about expected returns.

So instead of trying to second-guess the market by predicting news, investors can use the information already reflected in prices to build diverse portfolios

based on the dimensions that drive higher expected returns.

As citizens and media consumers we are all entitled to our individual opinions on whether news is good or bad. As investors though, we can trust market prices to assimilate news instantaneously and work from there.

In a sense, the work and the worrying are already done for us. This leaves us to work alongside an adviser to build diverse portfolios designed around our own circumstances, risk appetites and long-term goals.

There's no need to respond to second-hand news.

Risk Warnings

Past performance is not an indicator of future results. You should remember that the value of an investment and the income from it could go down as well as up. The return at the end of the investment period is not guaranteed and you may get back less than you originally invested.

MASECO Private Wealth trading as MASECO LLP is authorised and regulated in the United Kingdom by the Financial Conduct Authority (FCA) FRN: 489718, is registered in England and Wales under Company No. OC337650. The registered office address of the Firm is: Burleigh House, 357 Strand, London, WC2R 0HS.

All expressions of opinion are subject to change without notice and are not intended to be a guarantee of future events. This document is for information only and does not constitute a solicitation to buy or sell securities nor does it purport to be a complete description of our investment policy, markets or any securities referred to in the material. Opinions expressed herein are not intended to be a forecast of future events or a guarantee of future results or investment advice and are subject to change without notice or based on market and other conditions. Any reference to model portfolios, which is used for internal purposes, is purely illustrative. The value of investments and the income from them may fluctuate and can fall as well as rise. Past performance is not a guarantee of future results. You may not recover what you invest.

Although information in this document has been obtained from sources believed to be reliable, MASECO LLP does not guarantee its accuracy or completeness and accepts no liability for any direct or consequential losses arising from its use. Throughout this publication where charts indicate that a third party (parties) is the source, please note that the source references the raw data received from such parties.

MASECO LLP and its affiliates do not provide tax or legal advice and levels and bases of taxation can change. To the extent that this material or any attachment concerns tax matters, it is not intended to be used and cannot be used by a taxpayer for the purpose of avoiding penalties that may be imposed by law. Any such taxpayer should seek advice based on the taxpayer's particular circumstances from an independent tax advisor.

Neither asset allocation nor diversification assures a profit or protects against a loss in declining financial markets. Currency fluctuations may increase or decrease the returns of any investment.

Bonds are affected by a number of risks, including fluctuations in interest rates, credit risk and prepayment risk. In general, as prevailing interest rates rise, fixed income securities prices will fall. Bonds face credit risk if a decline in an issuer's credit rating, or creditworthiness, causes a bond's price to decline. High yield bonds are subject to additional risks such as increased risk of default and greater volatility because of the lower credit quality of the issues.

Bonds rated below investment grade may have speculative characteristics and present significant risks beyond those of other securities, including greater credit risk and price volatility in the secondary market. Investors should be careful to consider these risks alongside their individual circumstances, objectives and risk tolerance before investing in high yield bonds. High yield bonds should comprise only a limited portion of a balanced portfolio.

Finally, bonds can be subject to prepayment risk. When interest rates fall, an issuer may choose to borrow money at a lower interest rate, while paying off its previously issued bonds. As a consequence, underlying bonds will lose the interest payments from the investment and will be forced to reinvest in a market where prevailing interest rates are lower than when the initial investment was made.

Alternative investments referenced in this report are speculative and entail significant risks that can include losses due to leveraging or other speculative investment practices, lack of liquidity, volatility of returns on transferring interests in the fund, potential lack of diversification, absence of information regarding valuations and pricing, complex tax structures and delays in tax reporting, less regulation and higher fees than mutual funds and advisor risk.

Investing in commodities entails significant risks. Commodity prices may be affected by a variety of factors at any time, including but not limited to (i) changes in supply and demand relationships, (ii) governmental programs and policies, (iii) national and international political and economic events, war and terrorist events, (iv) changes in interest and exchange rates, (v) trading activities in commodities and related contracts, (vi) pestilence, technological change and weather, and (vii) the price volatility of a commodity. In addition, the commodities markets are subject to temporary

distortions or other disruptions due to various factors, including lack of liquidity, participation of speculators and government intervention.

The prices of real assets (for example, precious metals) tend to fluctuate widely and unpredictably, and have historically experienced periods of flat or declining prices. Prices are affected by global supply and demand, investors' expectations with respect to the rate of inflation, currency exchange rates, interest rates, investment and trading activities of hedge funds and commodity funds, and global or regional political, economic or financial events and situations.

REITs investing risks are similar to those associated with direct investments in real estate: lack of liquidity, limited diversification and sensitivity to economic factors such as interest rate changes and market recessions.

The indices are unmanaged, are shown for illustrative purposes only and do not represent the performance of any specific investment. Index returns do not include expenses, fees or sales charges, which would lower performance.

International investing entails greater risk, as well as greater potential rewards compared to investing in your local stock market. These risks include political and economic uncertainties of foreign countries as well as the risk of currency fluctuations. These risks are magnified in countries with emerging markets, since these countries may have relatively unstable governments and less established markets and economics.

Investing in smaller companies involves risks not associated with more established companies, such as business risk, significant stock price fluctuations and illiquidity.

Interest on municipal bonds is generally exempt from US federal income tax; however, some bonds may be subject to the alternative minimum tax (AMT). Typically, state tax exemption applies if securities are issued within one's state of residence; if applicable, local exemption applies for issues within one's city of residence.

The initial interest rate on an inflation-linked security may be lower than that of a fixed rate security of the same maturity because investors expect to receive additional income due to future increases in CPI. However, there can be no assurance that these increases in CPI will occur.

Changes in exchange rates may have an adverse effect on the value, price or income of foreign currency denominated securities.
