ISSUE 60 | March 2016

## | The Ordinariness of Market Falls

It is all too easy to get overly concerned about falls in the equity markets from previous highs. As humans, we are hard-wired to be concerned about recent events and feel losses keenly. However, it is also easy to ignore the fact that interim losses occur with monotonous regularity. Reminding ourselves of this fact, combined with a justified confidence in the power of global capitalism, allows us to overcome some of the concern that we may feel from time to time. Top tip: don't look at the value of your portfolio too often.

'In the short run, the market is a voting machine but in the long run,  
it is a weighing machine.'

**Benjamin Graham**

*It is not easy being an investor, but we can help ourselves*

This note is written, not in response to the supposedly surprising and disappointing start to the year (or so the press would have you believe), but because of its very ordinariness. What we have witnessed is not extraordinary in the slightest, as we shall see. 'The worst start to the year for decades' is simply a good headline whipped up by the media. What is also neither surprising, nor out of the ordinary, is the emotional response of investors who feel unease about short-term market falls. Worry, panic and, on occasion, the temptation to bail out of a sensible investment plan is not uncommon.

The sad fact is that, as human beings, we are very badly wired when it comes to investing. Our mental wiring, that evolved to allow us to make intuitive and rapid decisions to survive in the wilderness, does us a huge disservice when it comes to navigating the short-term vagaries of the markets. In the jargon of behavioural finance, the combination of focusing in on short-term events, coupled with the well-documented fact that investors feel twice as much pain from losses compared to the pleasure of gains, is known as myopic loss-aversion. It is a dangerous mindset, if long-term successful growth of wealth is the goal.

In this brief note we explore the obsessive focus on the immediate pain induced by short-term market movements, the very ordinariness of such market movements, and the need to retain a deep confidence in the ability of capitalism to generate wealth over the period of our investment horizon.

# The Ordinarity of Market Falls

## The remarkable nature of wealth creation through capitalism

Let's start by looking at the remarkable, persistent and robust wealth creation of global capitalism. Although in extremis, capitalism can be divisive, cruel and abused - look no further than the evolution to 'managers' rather than 'owners' capitalism that pervades the Wall Street and the City - it is a remarkable economic system that has delivered astounding results, in terms of innovation, reduction of global poverty, as well as increased human longevity and birth rates. We should celebrate its achievement and harbour real hope for the future. Ponder on these thoughts for a moment that illustrate just how wrong we can be to doubt its power:

- » In 1899 Charles H. Duell, Commissioner of the US Patent Office, stated that 'Everything that can be invented has been invented'. Enough said.
- » Even Bill Gates' vision failed to comprehend a future in 1981 anywhere near what has turned out to be the case today when he said '640K [of RAM] ought to be enough for anybody'. How wrong he was! The RAM on the computer that this article was written on is 4GB.
- » It is estimated that around two-thirds of all those in school today will end up in jobs that don't yet exist!
- » In our daily lives, things that a generation ago would have been seen in Star Trek, such as talking face-to-face with a friend or colleague on a hand held device are now part of everyday life, through FaceTime and Skype.

Innovation is not slowing but speeding up. Driverless cars are no longer science fiction, but a reality. Nuclear fission is no longer a pipe dream. The future is remarkably exciting.

## Wealth creation is remarkably robust over time

The real (after inflation) growth in GDP provides us with a fair sense of how the world's wealth has grown. In fact, the world's GDP growth after taking account of inflation – for both developed and emerging economies – is estimated be around 3% in 2016, despite all the doom and gloom peddled by market commentators. It is easy to ignore just how remarkable this is because, as humans, we are hopeless at compounding numbers in our head. At this rate (using the Rule of 72), global output would double every 24 years. The figure below illustrates the real growth in GDP in the UK from 1948 to 2014. In 2007 the economy was booming, yet in 2016 we now produce more than ever before, yet it does not feel like those times are back.

# The Ordinariness of Market Falls

So, despite the robust and enduring growth of global wealth and an exciting and optimistic view of the future, why do we get so despondent when, along the way, the equity markets fall?

## Benjamin Graham's voting and weighing machines

The subtle distinction between the long-term weighing machine (weighing up the economic returns due to investors providing capital) and the short-term voting machine that delivers the market's moment-by-moment prices, sits at the heart of the challenge that investors face.

At its simplest, the price of a share is the aggregate view of all investors' opinions of the future cash flows that the firm will generate discounted back into today's money by a discount rate reflecting the perceived risks of the company. Some will believe that the price is too high and will become sellers of the stock and others will believe that the price does not do the company credit and be buyers. The equilibrium price at which buyers and sellers transact is the best estimate of the value of a company at that specific point in time, given the information available. As the release of new information is random, so will the movement of prices be, in the short-term.

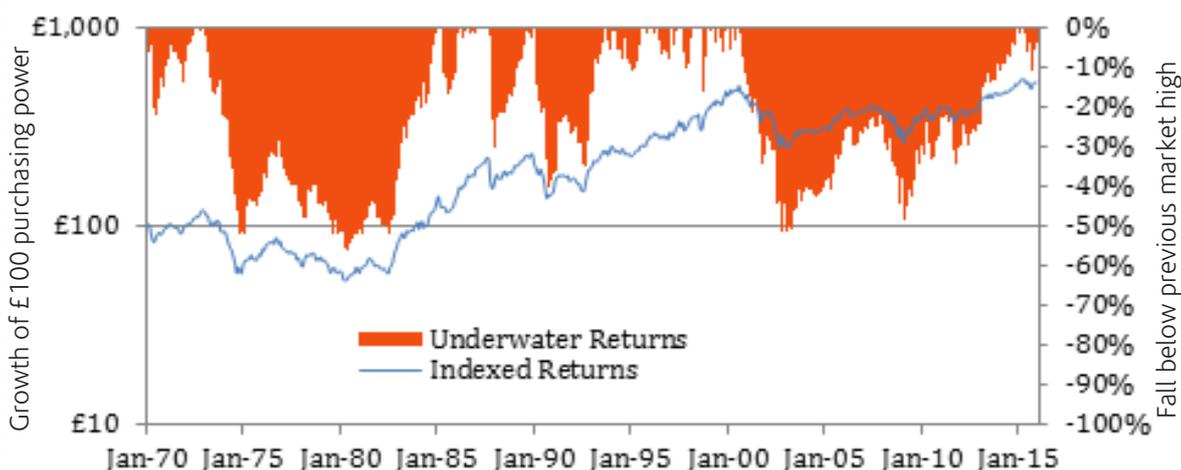

Market movements simply reflect the aggregate impact of new news on the future earnings prospects and risk of all companies that make up the market. The recent news that China's growth has slowed to a 'mere' 7% p.a. reduced the earnings outlook for companies around the globe and also dented some investors' confidence. This is Benjamin Graham's voting machine.

The weighing machine is the underlying, economic return – from dividends and the real growth in earnings – which an investor must eventually receive from the market, over time, driven by the interminable power of global capitalism.

## The ordinariness of market falls

A simple way to illustrate how normal market falls are is set out in the figure below. What it shows is the depth and time that markets – in this case global developed market equities – spend falling and recovering back to a the previous market high (the right hand scale). As investors we could spend most of our time being disappointed, if we allow ourselves to be. However, take a look at the blue line (the left hand scale). It shows the growth of £100 over time, despite the frequent periods of being underwater below the previous market high. Note that these returns are after accounting for inflation.

Figure 2: The depth and longevity of being below a previous market high (1970 – 2015)

Data: MSCI World Index (net divs.) in GBP, after inflation, from Morningstar © All rights reserved.

# The Ordinarity of Market Falls

The compound (or geometric) return over the period was a little under 4% per annum, after inflation. That means that £100 invested in 1970 became £533, despite the market crash in 1974, the oil crisis and sky-high inflation of the 1970s, the crashes of 1987 and 1990, the emerging market currency crisis of the late 1990s, the technology boom and bust, 9/11, the credit crisis from 2007 to 2009 and now China's slowing growth. That is a remarkable outcome – that long-term investors benefited from - scattered with frequent, deep and occasionally prolonged periods of market adjustment. This is evidence of the weighing machine at work.

## Why investors struggle with short-term market movements

Unfortunately, we are hard wired to ignore our rational thought processes and focus in on - and become emotional about - adjustments to share prices. Three key behavioural flaws, deeply embedded over millions of years surviving as a species, work against us.

The first is immediacy; this is the propensity to focus on something that is happening or has just happened, such as the readjustment of the outlook for global companies given China's slowing growth rate.

The second is anchoring; humans have a propensity to fixate – or anchor - on a specific reference point; this might be the previous high level of the market, portfolio valuation or house price. Investors were pleased when the FTSE 100 passed through 6,000 in 2013, thrilled when it hit 7,000 in 2015 and despondent now we are back at 6,000 or so. It is easy to forget, too, that these companies paid dividends – one of the rewards of being an owner - of around 3% each year, not reflected in the index.

The third is loss aversion; this - as described above – is where the ratio of downside pain relative to upside pleasure is 2:1. Whilst that kept us alive in our pre-history, it hinders us as investors.

You can probably spot the problem and the conflation of these three traits when the market – acting as a voting machine - readjusts to new, less positive information. Unfortunately the immediacy and pain is amplified by newspaper headlines, commentators such as Robert Peston (formerly of the BBC, whose favourite word during the credit crisis was 'contagion'), the evening news and irresponsible, headline grabbing research reports, such as that issued recently by RBS.

## So what is the solution?

The rational approach to dealing with the problem of myopic loss aversion starts with marveling at the creativity of capitalists at work and the wealth creation that ensues. The second is to remember that the market movements do not reflect an absolute measure of despondency or elation in the economic world, but simply a readjustment of the price of shares relative to a previous view, based on new information.

However, given that most investors struggle to be rational when times appear bleak, we have a number of defenses that we can erect around us, perhaps the most important being able to ignore or cut out the stimuli that agitate us.

The best place to start is by ignoring the headlines and laugh at the news, particularly when you hear that multiple billions have been wiped off the value of UK companies; that the market has reached a new high; or that we are entering a market correction or bear market, which are both arbitrary descriptors of ordinary market movements. Ask yourself: so what?

The other thing to do is not to look at your investments too often. The table below makes it obvious why. The more frequently you look, the more likely you are to see a loss, the more pain you will feel, and the more you will fixate on market noise rather than the power of capitalism. As you can see, if you look weekly, you have an almost one-in-two chance that you will see a loss. In the worst week ever (during the period under review) the

# The Ordinairiness of Market Falls

global equity markets fell by 22%. That is a frequency and magnitude of loss that most investors would find hard to stomach. Over any one-year period, you would have had a one-in-four chance of a negative return. Don't expect your portfolio to go up every year; it won't. Looking every five years reduces the chances of a loss to around one-in-ten.

Table 1: Looking too often is injurious to your health (Feb 1975 to Jan 2016)

'Look' frequency	Chance of loss	Chance of loss >-5%	Chance of loss >-10%	Chance of loss >-20%	Worst loss
Weekly	45%	2%	0%	0%	-22%
Monthly	38%	9%	1%	0%	-22%
Quarterly	31%	13%	5%	1%	-29%
6 months	31%	16%	10%	2%	-33%
1 year	23%	16%	11%	5%	-32%
3 years	16%	12%	9%	6%	-45%
5 years	10%	9%	7%	3%	-28%
10 years	3%	2%	1%	0%	-13%

If you can't help yourself from being concerned, perhaps work your way through the following mental checklist, when markets fall. If the answer to most of these questions is 'no', stop worrying

- » Do you need access to the money invested today, or even in the next 5 years?
- » Is the market falling a surprise to you?
- » Has capitalism ceased to be a driver of global growth and wealth creation?
- » Is the global economy shrinking?
- » Is it a good thing to sell equities when they have fallen?
- » Do you think that the market will be below where it is today in 10 years' time?
- » Do ordinary patterns of returns warrant extraordinary actions?

## Helping ourselves

In essence, our advice would be don't look too often at the value of your portfolio, stop listening to the hyperbole of the BBC and other media outlets and stop dwelling on the news. Do be optimistic about the power of the wealth creation potential of global capitalism, over the time frame you will be invested. We would even say, don't come to your annual review meeting worried about movements in your portfolio since your last review. What matters is whether the value of your assets is still within reasonable expectations, despite being down (or up). Short-term market movements are simply noise and best ignored. Finally, remember when markets are down, one of the favourite sayings of the legendary investor, Jack Bogle: 'This too shall pass!'

## Risk Warnings

Past performance is not an indicator of future results. You should remember that the value of an investment and the income from it could go down as well as up. The return at the end of the investment period is not guaranteed and you may get back less than you originally invested.

MASECO Private Wealth trading as MASECO LLP is authorised and regulated in the United Kingdom by the Financial Conduct Authority (FCA) FRN: 489718, is registered in England and Wales under Company No.OC337650. The registered office address of the Firm is: Burleigh House, 357 Strand, London, WC2R 0HS.

All expressions of opinion are subject to change without notice and are not intended to be a guarantee of future events. This document is for information only and does not constitute a solicitation to buy or sell securities nor does it purport to be a complete description of our investment policy, markets or any securities referred to in the material. Opinions expressed herein are not intended to be a forecast of future events or a guarantee of future results or investment advice and are subject to change without notice or based on market and other conditions. Any reference to model portfolios, which is used for internal purposes, is purely illustrative. The value of investments and the income from them may fluctuate and can fall as well as rise. Past performance is not a guarantee of future results. You may not recover what you invest.

Although information in this document has been obtained from sources believed to be reliable, MASECO LLP does not guarantee its accuracy or completeness and accepts no liability for any direct or consequential losses arising from its use. Throughout this publication where charts indicate that a third party (parties) is the source, please note that the source references the raw data received from such parties.

MASECO LLP and its affiliates do not provide tax or legal advice and levels and bases of taxation can change. To the extent that this material or any attachment concerns tax matters, it is not intended to be used and cannot be used by a taxpayer for the purpose of avoiding penalties that may be imposed by law. Any such taxpayer should seek advice based on the taxpayer's particular circumstances from an independent tax advisor.

Neither asset allocation nor diversification assures a profit or protects against a loss in declining financial markets. Currency fluctuations may increase or decrease the returns of any investment.

Bonds are affected by a number of risks, including fluctuations in interest rates, credit risk and prepayment risk. In general, as prevailing interest rates rise, fixed income securities prices will fall. Bonds face credit risk if a decline in an issuer's credit rating, or creditworthiness, causes a bond's price to decline. High yield bonds are subject to additional risks such as increased risk of default and greater volatility because of the lower credit quality of the issues.

Bonds rated below investment grade may have speculative characteristics and present significant risks beyond those of other securities, including greater credit risk and price volatility in the secondary market. Investors should be careful to consider these risks alongside their individual circumstances, objectives and risk tolerance before investing in high yield bonds. High yield bonds should comprise only a limited portion of a balanced portfolio.

Finally, bonds can be subject to prepayment risk. When interest rates fall, an issuer may choose to borrow money at a lower interest rate, while paying off its previously issued bonds. As a consequence, underlying bonds will lose the interest payments from the investment and will be forced to reinvest in a market where prevailing interest rates are lower than when the initial investment was made.

Alternative investments referenced in this report are speculative and entail significant risks that can include losses due to leveraging or other speculative investment practices, lack of liquidity, volatility of returns on transferring interests in the fund, potential lack of diversification, absence of information regarding valuations and pricing, complex tax structures and delays in tax reporting, less regulation and higher fees than mutual funds and advisor risk.

Investing in commodities entails significant risks. Commodity prices may be affected by a variety of factors at any time, including but not limited to (i) changes in supply and demand relationships, (ii) governmental programs and policies, (iii) national and international political and economic events, war and terrorist events, (iv) changes in interest and exchange rates, (v) trading activities in commodities and related contracts, (vi) pestilence, technological change and weather, and (vii) the price volatility of a commodity. In addition, the commodities markets are subject to temporary

distortions or other disruptions due to various factors, including lack of liquidity, participation of speculators and government intervention.

The prices of real assets (for example, precious metals) tend to fluctuate widely and unpredictably, and have historically experienced periods of flat or declining prices. Prices are affected by global supply and demand, investors' expectations with respect to the rate of inflation, currency exchange rates, interest rates, investment and trading activities of hedge funds and commodity funds, and global or regional political, economic or financial events and situations.

REITs investing risks are similar to those associated with direct investments in real estate: lack of liquidity, limited diversification and sensitivity to economic factors such as interest rate changes and market recessions.

The indices are unmanaged, are shown for illustrative purposes only and do not represent the performance of any specific investment. Index returns do not include expenses, fees or sales charges, which would lower performance.

International investing entails greater risk, as well as greater potential rewards compared to investing in your local stock market. These risks include political and economic uncertainties of foreign countries as well as the risk of currency fluctuations. These risks are magnified in countries with emerging markets, since these countries may have relatively unstable governments and less established markets and economics.

Investing in smaller companies involves risks not associated with more established companies, such as business risk, significant stock price fluctuations and illiquidity.

Interest on municipal bonds is generally exempt from US federal income tax; however, some bonds may be subject to the alternative minimum tax (AMT). Typically, state tax exemption applies if securities are issued within one's state of residence; if applicable, local exemption applies for issues within one's city of residence.

The initial interest rate on an inflation-linked security may be lower than that of a fixed rate security of the same maturity because investors expect to receive additional income due to future increases in CPI. However, there can be no assurance that these increases in CPI will occur.

Changes in exchange rates may have an adverse effect on the value, price or income of foreign currency denominated securities.

Investments or investment services referred to may not be suitable for all recipients.

In the UK, certain services are available through MASECO LLP (trading as MASECO Private Wealth and MASECO Institutional) which is registered in England and Wales, number OC337650, with registered offices at Burleigh House, 357 Strand, London, WC2R 0HS, telephone +44 (0)20 7043 0455, email enquiries@masecopw.com. MASECO LLP is authorised and regulated by the Financial Conduct Authority for the conduct of investment business in the UK. The Financial Conduct Authority does not regulate tax advice or offshore investments.
